FOX ANNOUNCES 52 IISP PROJECTS

Communications Minister Francis Fox has announced 52 Telidon projects that have qualified to receive a total of \$9.5 million in assistance under the Telidon Industry Investment Stimulation Program (IISP). The funding will pay for terminals to be used in the projects, which will be operated by private companies, crown corporations, non-profit organizations and educational institutions.

Project operators must agree to match the DOC contribution by purchasing an equal number of terminals. About 8,500 terminals will be installed under the program.

The qualifying organizations have proposed Telidon services ranging from business systems to computer-assisted learning and health programs. The applicants have suggested a number of ways to deliver their Telidon services. Some will operate over telephone lines, while others will employ cable, microwave, satellite or broadcast teletext signals.

(Continued, page 2)

La version française de ce bulletin peut être obtenue gratuitement auprès du Programme TÉLIDON, Ministère des Communications, Pièce 1706, Tour Journal sud, 300, rue Slater, Ottawa (Ontario) Canada K1A 0C8. Pierrette Tower (613) 593-6330.

NEW INFOMART/TIMES MIRROR VENTURE

Infomart of Toronto and Times Mirror Videotex Systems of Los Angeles have formed a new company to sell Telidon systems to U.S. videotex operators.

The joint venture, owned equally by the two companies, combines Infomart's expertise in system design, software development and page creation with the marketing ability of Times Mirror, Infomart President David Carlisle said. Times Mirror has extensive holdings in publishing, cable television and related communications undertakings. Infomart, a joint venture of Torstar Corporation and Southam Inc., is an electronic publishing and data base search service.

The new U.S. marketing venture was announced at a ceremony in Toronto attended by Canadian Communications Minister Francis Fox; Robert Erburu, President of The Times Mirror Company; Beland Honderich, Chairman of Torstar; and Southam President Gordon Fisher.

"We expect this joint venture will generate at least 20 sales of Telidon systems in the United States during the next three years," Carlisle said. The new venture will also operate its own Telidon systems in conjunction with local firms associated with the Times Mirror Company.

The first of these will be the Times Mirror home videotex service, to begin operation in Los Angeles and Orange counties in March 1982. The number of terminals for the service has been increased to 350. It will operate over cable and phone lines and offer information from The Los Angeles Times as well as a number of transactional services, such as tele-shopping from Sears, tele-banking from the Bank of

America, reservations for sports events and plays via Ticketron, and a gateway to airline reservation services.

EDMONTON CONSULTING FIRM OPENS

Alphatel Systems Ltd., a consulting firm specializing in Telidon systems and other computer applications, has begun operations in Edmonton. Formed in December 1981, Alphatel will focus on teleconferencing applications and training programs for businesses and educators.

"Our key thrust is to provide participant training in the use of Telidon," said Bob Abell, president of the new company.

Alphatel runs seminars for teachers on the use of microcomputers in classrooms. Abell was hired to evaluate the Alberta Correspondence School Telidon field trial, scheduled to end in April this year.

GRASSROOTS ADDS NEW SERVICES

The Grassroots videotex service for Manitoba farmers is growing steadily, with about 500,000 page accesses per month, says Infomart spokesman Bruno Leps. More than 320 terminals are now

in operation in the province. Infomart predicts 1,500 terminals in use by the end 1982.

Grassroots was developed by Infomart in co-operation with the Manitoba Telephone System, the Manitoba Ministry of Agriculture, and the federal Department of Communications. The service has been so successful that a California publisher has signed an agreement with Infomart to create a similar system in the San Joaquin Valley.

Several new information packages and interactive services will be added to the Winnipeg data base this year, says Infomart spokesman Ron Larocque. "Our research indicates that one of the principle benefits of videotex for the modern farmer is as a decision-making tool," Larocque says.

Among the new features planned for Grassroots this year are wire reports from Broadcast News, the Toronto Stock Exchange and the Chicago Board of Trade and 20 new interactive farm management functions, including a "Combine break-even calculator" and "Least-cost feed formulations."

These will allow farmers to enter variables related to their farms and calculate operating costs and optimal use of equipment, fertilizers, and so on. Messaging services will also be added this year, Leps says. "We expect Grassroots will be a 20,000-page data base by the end of '82 with 20 per cent of the pages updated on a daily or weekly basis."

Expansion of the Grassroots service to province-wide operation will be aided by the federal government through the Telidon Industry Investment Stimulation Program. The grant to MTS was

announced by Communications Minister Francis Fox in January.

Subscribers lease integrated Telidon sets from MTS for \$47.50 per month and pay a toll charge of five cents per minute to access the Winnipeg data base from anywhere in the province. There are no long distance charges for users in Manitoba. Those outside the province who wish to use the Grassroots service pay regular long distance or datapac rates and an annual subscription fee of \$500. The fee includes five hours a month of Datapac time.

For more information, contact

TELIDON ART CONTEST IN VICTORIA

ARTelidon '81, a competition to create Telidon graphics, was held in Victoria in October. Local artists were invited to take part in the event, which was organized by Ernest Chang of the University of Victoria's Department of Computer Science.

Each of the 21 participating artists was given two hours to create an image on an Apple II information provider system run on software developed by Chang. His Picture Creation System software allows an Apple II micro-computer with two disk drives and a graphics tablet to create the image, and a Telidon user terminal to display it. The program language was UCSD PASCAL.

Ten terminals and page creation systems were provided by the contest sponsors, AEL Microtel, PACE Computers, the KNOWLEDGE network of B.C., ITG Inc. and the federal Department of Communications. Sponsors also provided prizes of \$400 for best images in an open category and the theme category, "Communications and Education." Entries were judged by the artists.

The winner in the open category was Lis Erling's four-minute sequence of rectangles of different colors and fill patterns. Paul Nystadt won the theme category with a sequence of mountain landscapes followed by a sun rising, turning into a satellite broadcasting to a dish antenna that in turn relayed the signals to a human head.

An Apple-readable diskette of entries, which can be displayed on an Apple II computer with a PASCAL system, serial card and Telidon terminal, is available on loan at shipping cost. A videotape presentation is also available on loan from the University of Victoria for a small fee.

For more information, contact
Ernest Chang,
Dept. of Computer Science,
University of Victoria,
P.O. Box 1700, Victoria, B.C. V8W 2Y2.
(604) 721-7232.

BC TEL FOCUS ON BUSINESS APPLICATIONS

British Columbia Telephone's videotex service for businesses and institutions in Vancouver and Victoria is underway with 125 terminals in operation. BC Tel will spend \$3 million on the trial over an eight-month period

ending in July, 1982. The terminals are provided free to participating organizations to develop new Telidon applications.

Participants include hotels, advertisers, libraries, museums, banks, commodities dealers, forestry companies, schools, retail stores, and provincial and federal governments. Terminals are located in offices and public places. The system offers electronic messaging and a gateway to other data base services, including Marketscan (a stock market information service from the Toronto Globe and Mail), Grassroots from Manitoba, and the Department of Communications demonstration data base in Ottawa.

BC Tel has developed a new software package that allows subscribers to use either Telidon or standard ASCII business terminals. ASCII terminals cannot display Telidon's advanced color graphics, but by stripping out the Telidon Picture Description Instructions, the host computer allows the ASCII users to receive textual information from Telidon data bases. This also means hard copies of the text (but not graphics) can be made on low-cost printers.

The B.C. Tel system also permits users to obtain information with key-word access, using alphanumeric keypads or keyboards. The Telidon terminals are built by Norpak and AEL Microtel Ltd. Dominion Directory and Canada Videotex Services are major page creators.

For more information, contact

British Columbia Telephone Company,
7-3777 Kingsway,
Burnaby, B.C. V5R 5W2
(604) 432-3053

NEW TELIDON STANDARDS PUBLISHED

Enhanced technical standards have been developed for Telidon by the Department of Communications to incorporate new features compatible with the protocols announced by American Telephone and Telegraph last May in Toronto at Videotex '81. A committee of experts from DOC has reviewed the new standards, which will be published as CRC Technical Note 709-E, replacing the earlier publication, 699-E. The document will be available in English and French this Fall.

The new document is titled Telidon. Videotex Presentation Level Protocol: Augmented Picture Description Instructions. The authors are C.D. O'Brien, H.G. Bown, J.C. Smirle, Y.F. Lum and J.Z. Kukulka.

Telidon enhancements incorporated in the new standard include:

--Color mapping, which offers a selection of 4,096 colors, of which any 16 may be displayed on the same page simultaneously.

--Dynamically Redefinable Character Sets (DRCS). This feature allows for a Random Access Memory (RAM) where the user can store up to 96 new character shapes such as foreign alphabets. These DRCS characters can be down-loaded to the user terminal by the information provider.

--Macro PDI's. This feature allows coded instruction sequences for special elements (such as company logos) to be automatically repeated by the user terminal.

-- Incremental points, lines, and polygons allow the image to be tran-

smitted or displayed one point or element at a time. This is useful for common visual space applications as well as free-hand sketching and signatures.

-- Alpha-Mosaic PDI's. These allow the terminal to translate and display some types of alphamosaics.

Neither the DRCS nor alphamosaic modes proposed in DOC's 709 or similar AT&T or CBS standards are compatible with current European standards for DRCS or alphamosaic systems.

Andrej Tenne-Sens, Senior Technical Adviser to the Director General of Informatics Applications Management at DOC, described the publication of the new standard as an important step in the move towards adoption of the enhanced Telidon format as the North American standard for videotex. He noted that Canadian manufactures will have enhanced Telidon systems on the market early this summer.

Copies of CRC Technical Note 709 can be ordered from
Pierrette Tower

Telidon Publications, Room 1706

300 Slater St.
Ottawa, Ont. K1A 0C8
(613) 593-6330

"THE TELIDON BOOK" NOW AVAILABLE

The Telidon Book, edited by University of Victoria professors David Godfrey and Ernest Chang, is now available. The book includes a general description of Telidon, followed by detailed chapters on hardware, software, data base design and management, page crea-

tion and market development. The price is \$30. More than 2,000 copies had been sold by the end of February. Discounts are available on orders of more than 10 copies from Beaverbrook Distributing Company in Toronto.

A spokesman for the publisher, Porcépic Press Ltd., said U.S. rights for The Telidon Book have been sold and orders from other countries are being taken.

The publisher also announced that it will publish a third, revised edition of Gutenberg II, the earlier work on electronic publishing and information technology written by Godfrey and D.F. Parkhill, Assistant Deputy Minister, Research, of DOC.

For more information, contact
Porcépic Press,
217-620 View St.,
Victoria, B.C., V8V 1J6.
(604) 381-5502.

EDUCATION LIAISON OFFICER NAMED

Following a recommendation from the Canadian Videotex Consultative Committee's sub-committee on education, the Department of Communications has created a new position in the Informatics Applications Management Directorate to help the sub-committee meet its objectives. Nicky Eichler, formerly Director of Continuing Education in the Applied Arts Division of Algonquin College in Ottawa, has been appointed to the new position.

For more information, contact
Nicky Eichler
Room 1762, Journal Tower South,
Department of Communications,
300 Slater St., Ottawa, Ont. K1A 0C8.
(613) 995-4743.

U. OF WATERLOO OFFERS SOFTWARE

The Computer Communications Network Group at the University of Waterloo has created a campus-wide Telidon service with 30 Electrohome integrated user terminals and a data base of more than 1,000 pages. The university has also developed a new software package that allows several unique videotex services, including electronic messaging, global page labels, and private page labels.

With global page labels, the user can travel from one section of the data base to any other simply by typing an appropriate word. Unlike many keyword systems, the user does not have to return to an index page to begin a search.

Private page labels are similar to electronic book marks. They allow the user to assign personal codes to frequently read pages and return to those pages instantly, from any part of the data base, simply by typing the personal codes. The codes are known only to the user, and many users may use different codes to mark the same page.

The data base includes information on mathematics, arts, correspondence programs and other courses. The university will explore new educational applications, and is particularly interested in Telidon's potential as a supplement to correspondence courses. The system will also be used to inform visitors and high school students about the university and its programs, to assist lecturers and speakers, and in computer-aided learning programs.

Communications for the campus network are facilitated by a Gandalf private

automatic branch exchange (PABX). The university will sell or lease its Telidon software to other system operators. The software was designed for UNIX operating systems on Digital Equipment of Canada VAX or PDP-11 computers.

For more information, contact
Eric Manning,
Computer Communications Network Group,
University of Waterloo,
Waterloo, Ont. N2L 3G1.
(519) 885-1211 ext. 3509.

TELIDON SOFTWARE FOR IBM PERSONALS

A Calgary firm has introduced a software package that allows IBM Personal microcomputers to be used for Telidon videotex applications. Wayne Taylor and Peter Richardson, partners in Tayson Information Technology Inc., are selling their basic IBM software package for \$900, and are developing more complex packages for specialized Telidon applications. An IBM Personal equipped with one disk drive and the Tayson software can serve as host computer for a 1,000-page Telidon data base and drive a Telidon user terminal, a TV receiver or a video projector.

In recent demonstrations of the system in Ottawa, Taylor used an IBM micro with an AEL Microtel integrated user terminal. After loading the program diskette, he was able to control the micro with the keypad from the Telidon terminal, eliminating the need for a separate keyboard on the micro. Using specially-formatted Telidon pages, Taylor showed that the user could update text and graphics with a keypad.

Taylor noted that about 500 pages can be stored on an IBM diskette, allowing

the user to create information modules such as company reports. Diskettes can be stored under lock and key, or carried from one location to another by hand, thus guaranteeing security of the information.

The Tayson system is compatible with other Telidon systems. It can be used as a stand-alone data base or, with a modem, as a remote data base. The user can also access other Telidon data bases, retrieve pages and store them in the IBM system.

Tayson is aiming at the business market and expects the system will be used for sales presentations, briefings, interactive training packages, monthly reports, company manuals and other applications. Special applications software now under development includes an electronic billboard program that will display graphics at a higher speed and allow split fields on the display.

In addition to software sales, Tayson is offering page creation services and consulting services in system design, purchasing and implementation.
For more information, contact
Wayne Taylor,
Tayson Information Technology,
P.O. Box 30104, Station B
Calgary, Alta. T2M 4N7.
(403) 230-5998.

IT WALKS, IT TALKS, IT TELIDONS

An Ottawa company has begun leasing a line of walking, talking promotional robots equipped with Hemton Electronic Projector System Telidon terminals. The Telidon display, mounted in the "head" of the robot, is one of several options offered by The Robot Factory.

Company spokesman John Morris says the Model Six robot, which vaguely resembles R2-D2 of Star Wars, can be programmed to display a series of pages stored in the Hemton unit, or can be linked by radio to a remote data base. A keypad can be mounted on the robot, or the pages can be called up with a keypad by a remote operator. Model Six robots can be programmed to follow a pre-determined circuit and recite a pre-taped patter, or be controlled by a hidden operator with a microphone.

The Robot Factory's Model Six has been used in Canada and the U.S. for trade show and shopping centre promotions by car dealers, broadcasters, electronics manufacturers and others, Morris says. The company will tailor its robots to the client's request. Options include video-tape recorders, micro-computers, business-card and literature dispensers, air horns, balloon inflators and other assorted bells and whistles. The company leases several types and sizes of promotional robots and is now developing industrial machines.

U.S. VIDEOTEX INDUSTRY ASSOCIATION

The recently-formed Videotex Industry Association (VIA) of the United States has elected a 13-member board of directors from among representatives of some 50 companies. Larry T. Pfister, formerly of Telidon Videotex Systems, the subsidiary formed by Infomart in 1981 in Stamford, Con., was elected chairman of VIA. Gary Arlen, publisher of Videotex Teletext News,

is the new vice-chairman; Michael Cavanagh of Cavanagh Associates, Washington, D.C., is treasurer; and Washington, D.C., lawyer Howard Liberman, is secretary.

Directors are Sam Berkman of AT&T, Andrea Daggres of International Interact, Graeme Keeping of Source Telecomputing, Hadassa Gerber of McCann-Erickson, Richard Gingras of KCET-TV (Los Angeles), Ann Hardy of Tymshare, Henry Heilbrunn of the Associated Press, Bruce Sanderson of Cox Cable, Gary Stein of PlayCable, and Richard Veith of Logica.

The association was formed to represent the interests of the videotex industry and to promote videotex and teletext development in the U.S. Membership dues range from \$250 to \$3,000, depending upon the size and activity of the applicant.

For more information, contact

Jack O'Grady,
Videotex Industry Association,
2000 L St. NW, Suite 200,
Washington, D.C. 20039.

INET INFORMATION PROVIDERS NAMED

A wide range of information providers will participate in the iNET trial which begins operations in July, 1982. Sponsored by the Computer Communications Group of the TransCanada Telephone System, iNET is an intelligent network and electronic directory service that allows users to access a number of data banks with a single call to a central gateway computer.

During the trial, 250 Telidon terminals and 150 alphanumeric terminals will have access to the service. All

400 terminals will be in business or institutional settings. The trial is to run until July 1983, at which time CCG hopes to start commercial service.

Information providers for the trial include Canada Systems Group, the Canadian Press Newstex service, Info Globe, Concord Publishing, Infomart, Informatech, I.P. Sharp Associates, Official Airline Guides, QL Systems, and The Financial Post.

The federal government's Task Force on Service to the Public data base and Telidon data bases operated by NB Tel, Bell Canada and BC Tel will also be accessible.

Users of the service will include A.E. LePage Ltd., Calladine & Baldry, the Canadian Broadcasting Corporation, Gulf Canada, the Quebec Ministry of Justice, and the Royal Bank of Canada. The National Library of Canada and other public and educational libraries will also participate.

"iNET offers a full shopping list of vendors and information and eliminates the need for expert knowledge of computers," says John Farrell, director of the Computer Communications Group. "The network intelligence performs many functions for the user and even stores the level of expertise the user possesses as an aid to the novice. iNET will make it almost as easy as dialing a telephone for those seeking information."

For more information, contact
Ruth Foster,
Computer Communications Group,
TransCanada Telephone System,
Room 1150, 160 Elgin St.,
Ottawa, Ont. K1G 3J4.
(613) 567-3748.

WETA TELETEXT ENTERS PHASE II

The WETA Telidon teletext field trial in Washington, D.C. entered a new phase in January with a shift from hard news to news analysis, community information and video art.

Project director Red Burns said the new emphasis will be on analysis of news and events in and around the capital. The service has been redesigned to offer different content, new page formats and quicker access to pages.

Hard news was one of the most popular types of information in the first phase of the trial. User statistics showed that news, entertainment and weather pages were among the most widely read in the service.

Started in June, 1981 by the Alternate Media Center of New York University's School of the Arts, the trial involves 50 specially designed Norpak decoders with built-in recorders to keep track of users' viewing patterns. Ten terminals are in public places and 40 are in residential settings.

The teletext pages are broadcast in the Vertical Blanking Interval of the regular program signal of the Public Broadcasting Service station. They are decoded by a Norpak terminal attached to the TV set. For this trial, the teletext data is transmitted at a rate of 4.3 megabits per second, somewhat slower than the 5.7 megabits per second proposed in the Telidon-CBS-AT&T North American broadcast standard. At the end of the initial phase, the WETA teletext cycle comprised an average of 130 pages. Despite a high proportion of graphics, the average number of

bytes per page was only 800. The most complex graphics page in the cycle was the national weather map, containing about 2,300 bytes.

The Post, which updated news pages for the service from a terminal in its newsroom via a phone link to the Alternate Media Centre, will not be providing pages during Phase II. The newspaper is now investigating commercial teletext applications.

VIDEONET LAUNCHED IN AUSTRALIA

A new Telidon system has been developed by Myer Emporium Ltd. of Melbourne to serve businesses throughout Australia. The system was unveiled in April at a special media demonstration coinciding with the Technology in the World of Travel and Tourism symposium held in Sydney. The demonstration system, developed with the assistance of a number of Canadian companies, will be shown throughout Australia to attract subscribers to Videonet, which will begin commercial operations in the near future.

Videonet will be operated by Myer Communications, a subsidiary of The Myer Emporium Ltd., and will use Telidon technology to provide business information and communications services to subscribers in Australia and other parts of the South Pacific.

The Videonet demonstration system was organized and developed by Systemhouse of Ottawa. Other Canadian firms par-

ticipating in the project included AEL Microtel Ltd. of Burnaby, B.C., Dominion Directories Ltd. of Vancouver and Infomart of Toronto.

The Canadian companies provided equipment on loan, software, personnel training, and consulting services in data base design, system design, and page creation. Some members of the Videotex Information Service Providers Association of Canada (VISAPAC) also donated pages to Videonet for demonstration purposes.

Information providers for the Sydney demonstration included leading airlines, travel agents, resort operators and travel publishers.

Project Name: Lifestyles, Leisure & Sports

Project Description: A page creation and database service designed to provide data about sports training, injury prevention and physical education in both French and English. Potential users included Sports Canada, universities, coaches, sports clubs and athletes.

Project Name: Telidon

Project Description: To establish a page creation business in the British Columbia market

Project Name: Banking

Project Description: To develop, supply and install a Telidon-based information system as part of an electronic banking and financial information system designed to serve bank customers.

Project Name: Cable TV

Project Description: To demonstrate commercial viability of generating and distributing Telidon-based information via satellite for the U.S. Broadcast/cable industry.

Project Name: Real Estate

Project Description: To demonstrate the feasibility and viability of a real-estate data base administered by a city-wide real estate board.

Project Name: Teleshopping

Project Description: To demonstrate the feasibility and viability of Telidon as an in-house information system for a large supermarket chain and to investigate the application of Telidon for supermarket teleshopping

Project Name: Page Creation/Cost
Reduction

Project Description: To expand present
page creation capacity and develop com-
puter-based library of Telidon graphics
which as a result of their ease of access,
would reduce the cost of page creation.

Project Name: Teleguide

Project Description: 2,000 terminals will
be used to provide visitors, potential
visitors, and residents of Ontario with a
large volume of current information about
places, activities and service in
Toronto.

Project Name: Videokey

Project Description: To create Telidon
pages providing information about enter-
tainment, restaurants, shopping, etc. as
published presently in "What's On In
Ottawa" and "Key to Toronto" and similar
key publications.

Project Name: Telidon & Laurentian

Project Description: a five-phase program
to support education in remote places in
Northern Ontario using microwave and satel-
lite communication links. The program will
be bilingual and focus on mining, library,
noticeboard and course outline information

Project Name: Videopress

Project Description: Large screen electro-
nic billboards plus touch-screen user term-
inals to display advertising, news and
community information in shopping malls.

Project Name: Videotex Training Centre

Project Description: To establish and
operate an industrial training facility
including courses on page creation, video-
tex marketing and maintenance support.

Project Name: SX-2000 Telidon

Project Description: Creation of an integrated unit combining Mitel SX-2000 Superswitch with Telidon terminals to provide self-taught instructional training about the SX-2000 unit.

Project Name: Telemuse

Project Description: Page creation for museum programs, provision of pages for public data bases and a system to enhance inter-museum co-ordination and co-operation.

Project Name: Public Access Database

Project Description: To prepare and operate a national data base for museums (initially federal but later provincial museums) in order to test the use of Telidon in an exhibits setting.

Project Name: Fishnet

Project Description: To provide up-to-date information on all aspects of the fishing industry via Telidon including fish stocks by type, regulations and other information of interest to all Atlantic fishermen.

Project Name: Tourism Newfoundland

Project Description: To provide a data base and required terminals to operate a public information display system to promote tourism. Terminals will be placed in parks, historic sites and chalets.

Project Name: Augmented Channel Services

Project Description: The first stage is to offer subscribers information including consumer, transportation and TV program details. Later stages include several Telidon-based channels.
